Business Analyst Assignment

Role: MBA Fresher – Business Analyst

Project: Food Delivery App Improvement (Zomato)

1. App Analysis – Zomato

A. Key Problems (User Pain Points)

1. Delivery Delays

One of the major challenges faced by users is delayed order delivery, especially during peak hours such as weekends and dinner time. This issue arises due to inefficient route planning and a high volume of orders, which negatively impacts customer satisfaction and trust.

2. High Delivery Charges

Zomato often applies additional costs such as delivery fees, surge pricing, and taxes. These hidden or unexpected charges increase the total bill significantly, making the

service less attractive for price-sensitive customers.

3. App UI Complexity (User Interface Confusion)

The application interface contains excessive promotional banners, offers, and pop-ups. This cluttered design makes it difficult for users to quickly navigate, compare options, and make decisions, leading to a poor user experience.

B. Strengths (What Works Well)

1. Wide Restaurant Variety

Zomato offers a diverse range of restaurants and cuisines, catering to different tastes, budgets, and preferences. This variety enhances user choice and platform attractiveness.

2. Multiple & Convenient Payment Options

The app supports various payment methods, including UPI, debit/credit cards, digital wallets, and Cash on Delivery (COD). This flexibility improves accessibility and ease of transaction.

3. Real-Time Order Tracking

Zomato provides live tracking of orders, allowing users to monitor preparation and delivery status in real time. This feature increases transparency and builds customer confidence.

While Zomato excels in providing variety and convenience, addressing operational inefficiencies (delivery delays), pricing transparency, and UI simplification can significantly enhance the overall customer experience and strengthen customer retention.

2. User Persona

A. User Profile

Name: Riya Sharma

Age: 24 Years

Profession: Marketing Executive

Location: Urban City (e.g., Delhi)

Income Level: Mid-income (₹25,000 – ₹40,000/month)

Tech Savviness: High (frequent mobile app user)

B. Goals (What the User Wants)

Quick and hassle-free food ordering experience

Affordable meal options with good discounts

Fast and reliable delivery service

Easy navigation to find preferred restaurants

Transparent pricing without hidden charges

C. Needs

User-friendly and simple app interface

Accurate delivery time estimates

Personalized recommendations based on past orders

Secure and multiple payment options

D. Pain Points (Challenges Faced)

High delivery and additional charges

Frequent delays during peak hours

Difficulty in finding relevant restaurants due to cluttered UI

Confusion caused by excessive offers and pop-ups

Lack of quick resolution for complaints

E. Behavior & Usage Pattern (Advanced MBA Point)

Orders food 3–4 times per week

Prefers ordering during evenings and weekends

Compares prices and ratings before ordering

Influenced by discounts and reviews

F. Quote

"I want my food to arrive quickly at a reasonable price without wasting time searching through too many options."

3. User Journey Mapping – Zomato

A. Overview

The user journey represents the complete experience of a customer from opening the app to giving feedback after delivery. Identifying friction points at each stage helps improve user satisfaction and business performance.

B. Journey Stages with Friction Points

1. Open App

User launches the Zomato app

Browses homepage

Friction Point:

Slow loading due to heavy content and ads

2. Search Food / Restaurant

User searches for cuisine, restaurant, or dish

Applies filters (rating, cost, delivery time)

Friction Point:

Too many irrelevant options

Poor filtering experience

3. Select Item

User selects restaurant and food items

Checks ratings, reviews, and menu

Friction Point:

Confusing discounts and multiple offers

Hard to compare final prices

4. Add to Cart & Place Order

User adds items to cart

Proceeds to checkout

Friction Point:

Hidden charges (delivery fee, taxes, surge pricing)

Final bill higher than expected

5. Payment

User selects payment method (UPI, card, wallet, COD)

Friction Point:

Occasional payment failures

No clear refund timeline

6. Delivery

Order is prepared and assigned to delivery partner

User tracks order in real time

Friction Point:

Delivery delays during peak hours

Inaccurate delivery time estimates

7. Feedback & Support

User rates the order and experience

Raises complaint if needed

Friction Point:

Slow or ineffective customer support

Lack of proper resolution

C. Journey Flow chart

Open App

↓

Search Food

↓

Select Item

↓

Add to Cart

↓

Payment

↓

Delivery

↓

Feedback

4. Solution Recommendations

Problem	Solution
Delivery delays	Use AI-based route optimization and better delivery partner allocation
High delivery charges	Introduce subscription plans like “Zomato Pro” for free delivery
UI confusion	Simplify app interface with personalized recommendations
Hidden charges	Show transparent pricing before checkout
Poor complaint handling	Add faster customer support chat system

4. Dataset Analysis – Zomato

A. Dataset Variables Used

Restaurant Name

Location
Rating
Cost for Two
Cuisine
Votes (Popularity)
B. 1. High Rating vs Low Rating Analysis
Segmentation
High Rating: 4.0 and above
Low Rating: Below 4.0
Analysis
High-rated restaurants usually have:
Better food quality
Higher number of votes
Premium pricing
Low-rated restaurants:
Lower customer engagement
Fewer reviews
Budget-friendly pricing
Insight
There is a positive relationship between rating and popularity (votes)
Customers trust restaurants with higher ratings and more reviews
C. 2. Expensive vs Cheap Restaurants Analysis
Segmentation
Expensive: ₹700 and above
Affordable: Below ₹700
Analysis
Expensive restaurants:
Higher average ratings (4.2 – 4.7)
Better service and quality perception
Affordable restaurants:
Mixed ratings (3.5 – 4.0)
High demand due to price sensitivity
Insight

Price influences perception of quality

However, affordable restaurants dominate in order volume

D. 3. Location-wise Trends Analysis

Observation

Different cities show different performance:

Some locations have higher average ratings

Some have higher order volumes (votes)

Example Insight

Metro cities:

Higher competition

Better ratings due to quality pressure

Tier-2 cities:

Lower ratings but growing demand

Insight

Location impacts:

Customer expectations

Restaurant quality

Pricing strategy

E. Advanced Insights

Correlation Insight

Ratings $\uparrow \rightarrow$ Votes $\uparrow$ (Strong positive relationship)

Cost $\uparrow \rightarrow$ Rating $\uparrow$ (Moderate relationship)

Business Insight

Focus on high-rated restaurants $\rightarrow$ increase conversions

Improve low-rated vendors $\rightarrow$ better platform reputation

Optimize pricing strategies by location

Conclusion

The dataset analysis shows that ratings, cost, and location are key drivers of customer behavior. Restaurants with higher ratings and better visibility receive more orders, while pricing plays a crucial role in customer decision-making.

5. Business Impact Analysis

1. Increased Customer Satisfaction

Faster delivery and better UI improve user experience

Leads to higher ratings and positive reviews

2. Higher Customer Retention

Subscription plans encourage repeat orders

Users stay loyal to the platform

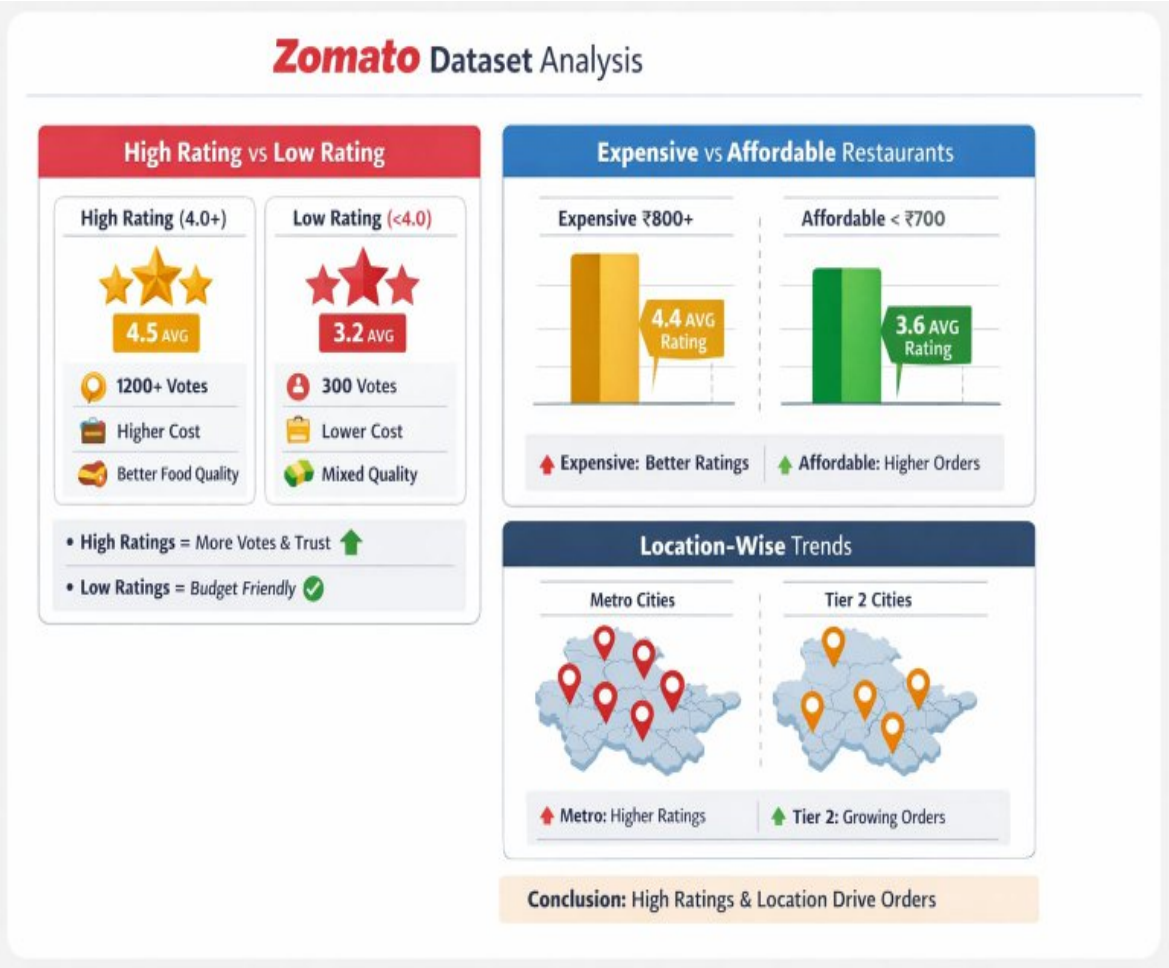
3. Revenue Growth

More orders due to improved experience

Subscription model generates recurring revenue

4. Competitive Advantage

Better service helps outperform competitors like Swiggy



Dataset Analysis

1. Rating vs Cost Analysis

Expensive restaurants (₹700–₹900) tend to have higher ratings (4.2–4.7)

Budget restaurants (₹300–₹500) show lower ratings (3.5–3.9)

Insight: Higher price often reflects better quality or service

2. Location-wise Trends

Bangalore: Highest average rating (~4.3+)

Delhi: Moderate ratings (~4.1)

Mumbai: Slightly lower (~3.9)

Insight: Service quality varies by city → opportunity for standardization

3. Votes vs Rating (Popularity Analysis)

Restaurants with more votes tend to have better ratings

Insight: Popular restaurants maintain consistency → trust factor

1. Scatter Plot

X-axis: Cost for two

Y-axis: Rating

Shows price v/s quality relationship

2. Bar Chart

X-axis: Location

Y-axis: Average Rating

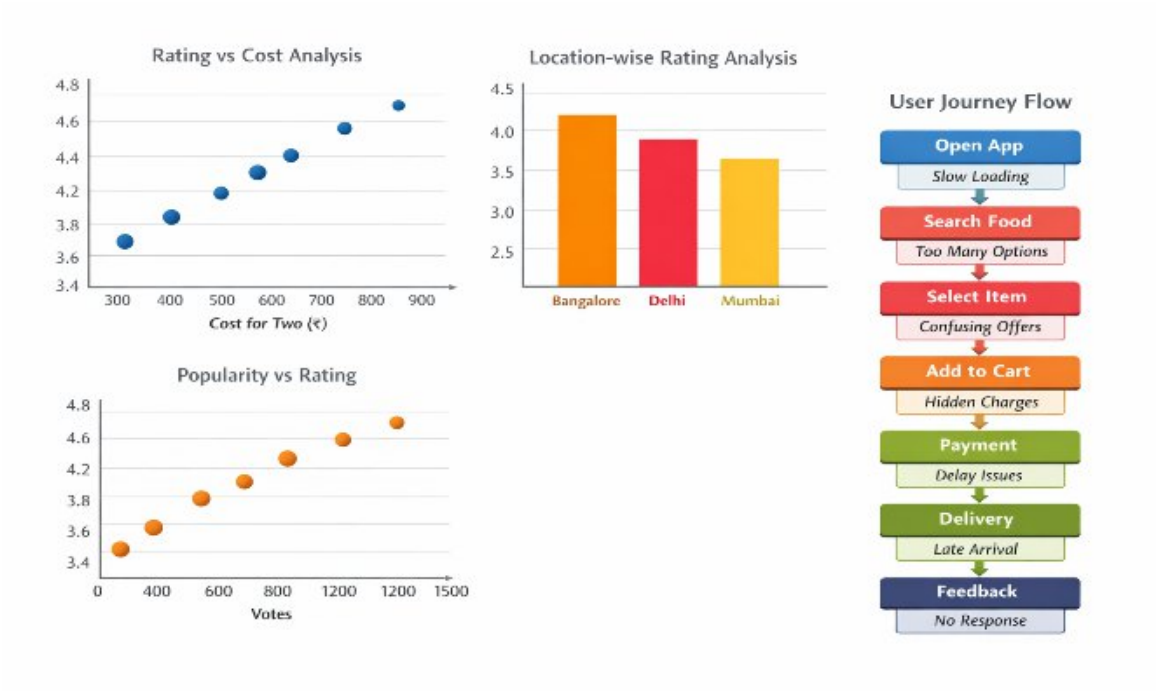
Shows city performance

3. Scatter Plot

X-axis: Votes

Y-axis: Rating

Shows popularity vs quality



Conclusion

Improving delivery efficiency, pricing transparency, and user interface can significantly enhance the overall user experience of Zomato. These changes not only solve customer problems but also drive business growth, retention, and long-term success.
